Q1 Void Function (No Return Value)

5 marks

Write a Python program to define a function that displays "Welcome to Python Programming".

Your Code

```
1 def function():  
2     print( "welcome to Python Programming")  
3 function()
```

Input

stdin input

Output

```
"welcome to Python Programming"
```

Q2 Void Function (No Return Value)

5 marks

Write a function to print the multiplication table of a given number.

Your Code

```
1 def function(n):  
2     for i in range(1,11):  
3         print(n,"x",i,"=",n*i)  
4 num = int(input("enter the number\n"))  
5 function(num)
```

Input

5

Output

```
enter the number  
5 x 1 = 5  
5 x 2 = 10  
5 x 3 = 15  
5 x 4 = 20  
5 x 5 = 25
```

Q3 Void Function (No Return Value)

5 marks

Write a function to print all even numbers from 1 to N.

Your Code

```
1 def even_numbers():
2     for i in range(1,n+1):
3         if(i%2 == 0):
4             print(i,end= " ")
5 n =int(input("enter the number"))
6 even_numbers()
```

Input

86

Output

```
enter the number2 4 6 8 10 12 14 16
18 20 22 24 26 28 30 32 34 36 38 40
42 44 46 48 50 52 54 56 58 60 62 64
66 68 70 72 74 76 78 80 82 84 86
```

Q4 Fruitful Function (Returns One Value)

5 marks

Write a function that accepts a string and returns the number of vowels in it.

Your Code

```
1 def vowels():
2     count = 0
3     a = len(name)
4     for j in name:
5         if (j== 'a' or j == 'e' or j == 'i' or j == 'o' or j== 'u'):
6             count = count+1
7     print("no of vowels =",count)
8 name=input("enter the string")
9 vowels()
```

Input

revanthsai

Output

enter the stringno of vowels = 4

Q5 Fruitful Function (Returns One Value)

5 marks

Write a function that accepts a list of integers and returns the largest element.

Your Code

```
1 def integers():  
2     b = max(a)  
3     print("largest digit amount given integers ",b)  
4 a = list(map(int,input("enter the integers").split()))  
5 integers()
```

Input

4 66 33 11 2 3 4 5 6 7 89 0

Output

```
enter the integerslargest digit  
amount given integers 89
```

Q6 Fruitful Function (Returns One Value)

5 marks

Write a function that accepts a number and returns whether it is prime or not.

Your Code

```
1 def prime_function():
2     for i in range(2,n):
3         if(n % i == 0):
4             print("not a prime number")
5             break
6     else:
7         print("Given number is prime")
8 n= int(input("enter the number \n"))
9 prime_function()
```

Input

7

Output

```
enter the number
Given number is prime
```

Q7 Function Returning Two or More Values

5 marks

Write a function that accepts a student's marks in three subjects and returns the total, average, and grade.

Your Code

```
1 def student_performance():
2     total = a + b + c
3     avg = total / 3
4     if (avg >= 90):
5         print("A")
6     elif (avg >= 70 and avg < 90):
7         print("B")
8     elif (avg >= 50 and avg < 70):
9         print("C")
10    else:
11        print("Fail")
12    print("Total Marks", total)
13    print("average marks ", avg)
14 a = int(input("enter the marks of subject a\n"))
15 b = int(input("enter the marks of subject b\n"))
16 c = int(input("enter the marks of subject c\n"))
17 student_performance()
```

Input

90
90
91

Output

```
enter the marks of subject a
enter the marks of subject b
enter the marks of subject c
A
Total Marks 271
average marks 90.33333333333333
```

Q8 Function Returning Two or More Values

5 marks

Write a function that accepts the radius of a circle and returns its area and circumference.

Your Code

```
1 def function():  
2     area = 3.14*r*r  
3     circumference = 2*3.14*r  
4     print("area of circle",area)  
5     print("circumference of circle ",circumference)  
6 r = int(input("enter the radius"))  
7 function()
```

Input

10

Output

```
enter the radiusarea of circle  
314.0  
circumference of circle  
62.800000000000004
```

Q9 Function Returning Two or More Values

5 marks

Write a function that accepts a number and returns its square, cube, and square root.

Your Code

```
1 import math
2 def function():
3     square = num * num
4     cube = num * num * num
5     square_root = math.sqrt(num)
6     print("square", square)
7     print("cubic", cube)
8     print("square root", square_root)
9 num = int(input("enter the number"))
10 function()
```

Input

9

Output

← Back

Q10 Keyword Arguments

5 marks

Write a function student(name, age, department) and call it using keyword arguments.

Your Code

```
1 def student(name, age, department):  
2     print("name", name)  
3     print("age", age)  
4     print("department", department)  
5 student(name="revanthsai", age = "18", department="cse")
```

Input

stdin input

Output

```
name revanthsai  
age 18  
department cse
```
